Why choose Ortho Creation Aligners?

We offer a revolutionary orthodontic experience that minimizes the need for frequent doctor visits, ensuring convenience and saving time. Our aligners are easy to clean and maintain, providing optimal hygiene without food restrictions or the discomfort often associated with traditional braces. Designed for a seamless lifestyle, they are pain-free, lightweight, and virtually invisible.

Choose Ortho Creation Aligners as your trusted partner for the perfect alignment journey.

How Does it Work?

1.

Creating a dental impression through a digital scan of the teeth using a 3D Scanner.

2.

Formulating a detailed treatment plan with defined end results using software for planning & designing.

3.

3D Printing & Fabrication of ortho creation Aligners as per treatment.

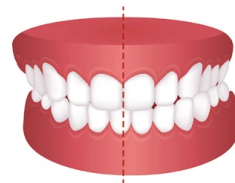

4.

Ready to deliver

CASES TREATED BY CLEAR ALIGNERS

THE CROSSBITE

The crossbite occurs when the upper and lower teeth do not meet correctly in a bite position. This can be caused by factors such as the abnormal eruption of permanent teeth, distortion to the bone and incorrect jaw positioning.

CROOKED TEETH

If the jaw is too small then crowding, overlapping or twisting of the teeth occurs as they move or get forced around for better positioning. Loss of permanent teeth also allows for the incorrect movement of the remaining teeth

THE OPEN BITE

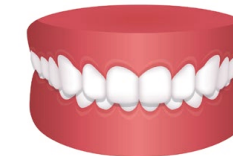

An open bite occurs when the front upper and lower teeth don't touch when the jaw is shut. This condition generally occurs due to dental or jaw alignment problems and is often the result of thumb sucking as an infant or toddler.

UNDERBITE

An underbite is when the lower jaw and teeth extend beyond the upper jaw and teeth. The main cause of an underbite is a misalignment of the lower jaw, usually present at birth due to genetics or because of an injury to the face or jaw.

OVERBITE

An overbite occurs when the top front teeth extend beyond the bottom front teeth. Most people have a slight overbite, but when the lower jaw is proportionately too small for the upper jaw then dental and other problems may occur.

SPACING

A number of factors cause gaps between the teeth, such as the difference in the size of the teeth relative to the jaw, loss of permanent teeth, gum disease and the actual size of the teeth. Teeth that are too small will create spaces and gaps.
